

Nucor Features & Benefits

Nucor Continuous Girts

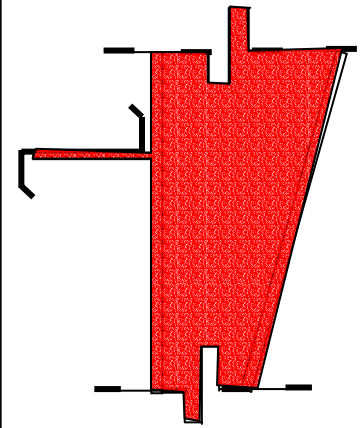

Features

1. Continuous girts develop the lowest cost solution.
2. Girts are outside of the columns.
3. Column clips are factory welded.

Benefits

1. By far the most often used framing solution; continuous girts result in the lowest building cost to the owner.
2. Outset girts do not require the field drilling of holes for wind brace rods.
3. Factory welding clips reduces erection time and money.

What You Should Know

1. Continuous girts give the lowest cost building solution in most cases.
2. Girt clips work as a shelf to rest the girt upon until the connection is made.
3. Nucor girts are “toed down” making erection much safer to erect.
4. Windbrace rods are inside the column and do not interfere with the girts. No field drilling of girts is required.
5. Since continuous girts cost less, be careful of last minute changes to the order. Changing from continuous girts to flush or inset will cost more.
6. Since continuous girts are more efficient, the girt size may be smaller than the same bay where inset or flush girts are required.
