

# Nucor Features & Benefits

## Nucor Gutter

1. The Nucor Gutter is designed to prevent ice and heavy rain from flooding the roof. The top of the Nucor gutter is located at the bottom of the roof panel. Ice can happen, even in the Deep South as this photograph of a competitor's gutter shows.

2. Gutter support brackets are tooled and hide the end of the roof panels from view. This gives a clean look to the building.
3. Gutter support brackets are heavy gage Galvalume® steel and can be easily field painted to match the roof color.
4. The Nucor Gutter is one of the largest in the business. The large size allows water to quickly flow from the roof. Nucor engineers design the gutters and downspouts to work together to drain the roof.
5. Large gutters can reduce the number of underground drains, thereby reducing the total project cost.
6. Collector boxes can be added to the gutters to increase capacity of downspouts. This too can reduce the number of downspouts and underground drains.
