

# NUCOR LISTENS

## Finally a Translucent Panels that Works!

Is it too much to ask to develop a translucent panel for standing seam that works and is easy to install? How about eliminating many of those parts that are tedious to install and because of their tediousness, become problematic? Owners want natural light, erectors want efficiency and dependability, and manufacturers want the quality that keeps customers coming back. How can this be accomplished?

Typical details require multiple parts and pieces and scores of screws. If the erector installs 98% correctly each and every translucent would leak. These are not very good odds. There has to be better way! How can this be done?

It's not hard if you are willing to roll up your sleeves and get to work. You see, it would be easy to say "It's never been done," or "We don't have time to spend on a product that has been on the market 25 years." While others were seeing ways not to change, the team put together by Nucor was busy getting the job done.

When it came to developing quality products, we didn't stop at talking the talk. We decided to walk the walk. With our supplier's help, we implemented a new standard that not only gives owners the natural light they wanted, but also provided protection from the elements that they need. Did we mention that the light is seamed into the panel eliminating a large part of the tedious work for the erector? Does it cost more? Sure does, unless you count the hours saved on installation or call backs.

Seems simple doesn't it? Well it is. Listening to the good ideas of erectors makes us smart. Executing good ideas makes us smarter.
