

# NUCOR LISTENS

## Ambidextrous Standing Seam Panels?

“Why can’t I install both sides of the roof at the same time? Don’t you understand just how much better construction would be if your roof could do just that one thing?”

How many times should a manufacturer hear that question before they step up to the plate and perform the research to make the tooling changes that are necessary? Talking is easy; implementing change shows that we are committed to listening. It’s a simple thing isn’t it? We have found that listening is a good thing and that simple is better. Planning is important to contractors. Having products that impede planning can cost you time and money. The easier your products are to install, the faster your projects go.

It was no easy task to redesign our product. Tooling had to be changed. Erection manuals had to be revised. Standard drawings and miles of computer code had to be revisited. Even brochures had to change. Why would Nucor undertake such a change? It is simple, what is good for the erector is good for Nucor. The result was a roof that considered the needs of the erector during construction. The erector now has options when planning his work. The erector can now cover important machinery, the end of an existing building, or areas of the slab that needed to be dry for other trades.

Seems simple doesn’t it? Well it is. Listening to the good ideas of erectors makes us smart.
