Nucor Announces Comprehensive Greenhouse Gas Reduction Targets

Even though Nucor's steel mill greenhouse gas emissions are already 1/3 of the global average, Nucor is committed to doing more to lessen the impact steelmaking has on the environment.

In July, Nucor committed to an additional 35% combined reduction in the Scope 1 and Scope 2 GHG emissions intensity of its steel mills by 2030. This commitment will be measured against a 2015 baseline, the year the Paris Climate Agreement was adopted. This will lower Nucor's GHG emissions intensity of steel mills to 77% less than today's global average.

Beyond 2030 we are committed to continuing reductions in carbon intensity...Towards the ambition of zero-emission steel at scale.
